
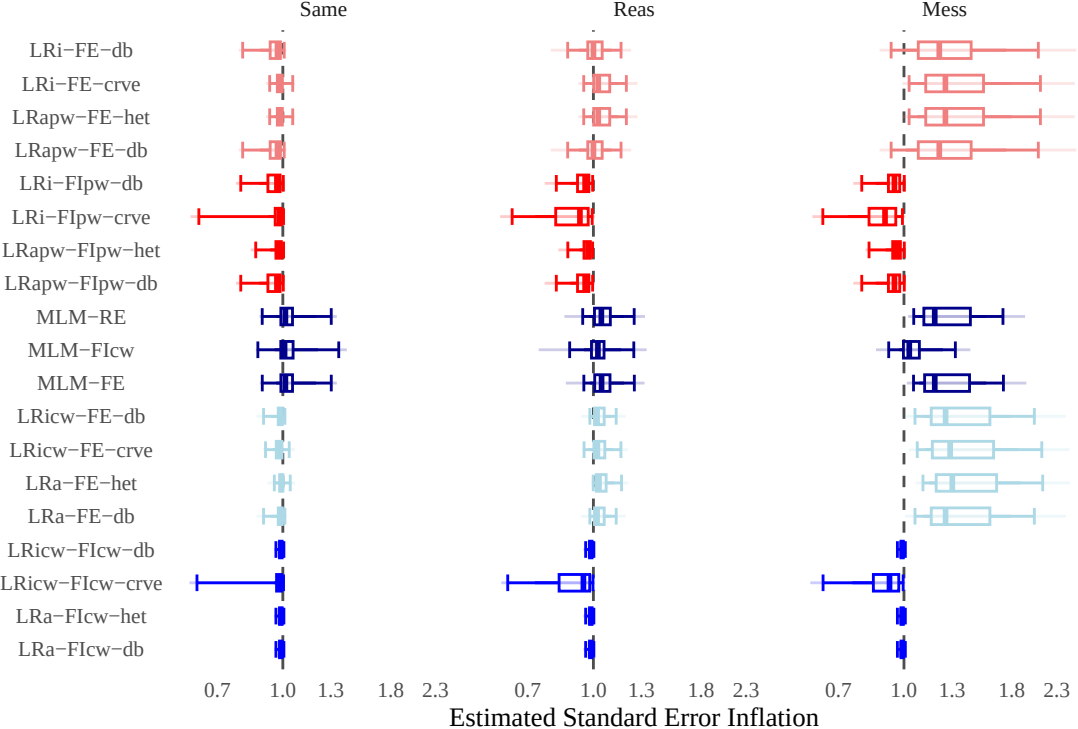

Figure 6: Boxplot of estimated standard error inflation across different simulation scenarios by method. Standard error inflation is measured as the ratio of the estimated standard error over the true super population standard error. Values above 1 indicate overestimation, values below 1 indicate underestimation. The faint horizontal lines extend to the full range, the bars span the 2.5th to 97.5th percentiles, and the boxes span the 10th to 90th percentiles.
